Assignment 5

1. The hollow concrete blocks are laid on the foundation. As per your knowledge, what is the height of this foundation?

2. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

3. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

4. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

5. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

6. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

7. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

8. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

9. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

10. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

11. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?

12. The hollow concrete blocks were constructed in the same manner. The flexural stress in the blocks was 40 MPa on a side, and the total stress in the blocks was 100 MPa. What is the flexural stress on the diagonal of the block?
