1) Which of the following protocols would be cost effective and reliable for long distance wired communication with multiple devices?
   - RS-232
   - SPI
   - I2C
   - RS-485
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   RS-485

2) How does a master device start to send data via I2C?
   - By sending the address of the slave on the SDA line
   - By sending the data first
   - By pulling the SDA line LOW while the SCL remains HIGH.
   - By sending clock pulses on the SCL line.
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   By pulling the SDA line LOW while the SCL remains HIGH.

3) 115200-Baud means
   - Baud rate of 115200, 8 data bits, Odd parity, 1 stop bit.
   - Baud rate of 115200, 8 data bits, Odd parity, 1 stop bit and a start bit.
   - 8-bit data with odd parity being sent with a clock signal of 115200Hz.
   - 8-bit data including odd parity and a stop bit being sent with a clock signal of 115200Hz.
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   Baud rate of 115200, 8 data bits, Odd parity, 1 stop bit.

4) How much time will it take to transmit 10 bytes of data using the UART interface if the UART Communication is specified by 9600-8-N-1?
   - 1.25ms
   - 11.11ms
   - 0.11ms
   - 0.5ms
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   1.25ms

5) Which method is preferable to measure frequency around 0.24Hz and 1KHz respectively?
   - Time period method, Direct Frequency method
   - Direct Frequency, Time Period method
   - Both with direct frequency method
   - Both with time period method
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   Time period method, Direct Frequency method

6) In a setup, an unknown signal is passed through MAX-2 counter and fed to MSP430, which then captures the rising edge and falling edge times in its register. If the values are (240.73)μs and (727.51)μs respectively and the timer is clocked at 32768μs, What is the frequency of the original unknown signal?
   - 32.769Hz
   - 6.5399Hz
   - 3.2376Hz
   - 1.6280Hz
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   6.5399Hz

7) Why is it better to divide the frequency of an external clock signal by 2 and then process it further?
   - So that it doesn’t damage the internal circuit of the Comparator.
   - Because the external signal has high frequency as compared to processor.
   - So that signal has equal HIGH and LOW times and thus the system has enough time to process data at either rising edge or falling edge.
   None of these.
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   Do not signal has equal HIGH and LOW times and thus the system has enough time to process data at either rising edge or falling edge.

8) MSP430 Timers, in capture mode, can capture
   - Only Rising edge
   - Only Falling edge
   - Both Rising and falling edge
   - High and Low level
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   Both Rising and falling edge

9) How many LEDs can be controlled independently by Charlieplexing using 16 pins of a microcontroller?
   - 8
   - 16
   - 32
   - 64
   No, the answer is incorrect
   Score 0
   Accepted Answers:
   16

10) What should be the very first step towards making any project from scratch?
    - Visualization
    - Start making a prototype
    - Deciding the aim and objective of the project
    - Design PCB then move further
    No, the answer is incorrect
    Score 0
    Accepted Answers:
    Deciding the aim and objective of the project
