Assignment 7

The data for all the assignments has passed.

As per our records you have not submitted this assignment.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of young people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.

1. The population of people in a city has 180 old, 200 children and 300 young people. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of old people = 20
- Number of children = 20
- Number of old people = 30

2. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

3. In a group of children, 200 children are studied. Considering age is a random variable and sample size is 200, calculate the mean and standard deviation of the sample.

- Number of children = 20
- Number of children = 20
- Number of children = 30

The data for all the assignments has passed.
