Assignment 5

1. A three-pointed arch is used in bridge construction. The arch is designed to carry the weight of the bridge and distribute it to the supports.

2. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

3. The arch is a type of curved shape that is used to distribute weight and create a strong, stable structure.

4. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

5. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

6. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

7. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

8. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

9. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

10. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

11. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

12. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

13. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

14. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.

15. The arch is a geometric shape that is often used in architecture and engineering. It can be used to create a strong, stable structure.
