1) It is intended to resolve high frequency fluctuations induced by small scale eddies in the highly turbulent flow over a flat plate, of the following which method is more suitable to solve this problem

- RANS
- LES
- Both a and b
- None of the above

No, the answer is incorrect.
Score: 0
Accepted Answers:
LES

2) What happens to the pressure drag if flow in the boundary layer suddenly transits to turbulent in the flow past a sphere

- Increase
- Decrease
- Remains unaltered
- Increases and then decreases

No, the answer is incorrect.
Score: 0
Accepted Answers:
Decrease

3) Air at 25°C and 1 atm from a blower made to flow over a long flat plate with a velocity of bulk velocity 8 m/s. Take critical Reynolds number $Re_c$ as $5 \times 10^5$; if the bulk velocity is doubled (i.e. 16 m/s), what happens to boundary layer thickness

- Decrease by two times
- Decrease by four times
- Increases by two times
- Increases by four times

No, the answer is incorrect.
Score: 0
Accepted Answers:
Decrease by two times

4) Air at 152.77 m/s is blowing parallelly over the surface of 4-m-high and 10-m-long wall. If the air outside is at 5°C and the surface temperature of the wall is 12°C, estimate the rate of heat loss from that wall by convection

- $-5.12 \text{ kW}$
- $-9 \text{ kW}$
- $-25 \text{ kW}$
- $-17.23 \text{ kW}$

No, the answer is incorrect.
Score: 0
Accepted Answers:
$-9 \text{ kW}$

5) If the flow in the boundary layer suddenly becomes turbulent (assume Reynolds number is doubled), the resultant Stanton number becomes

- Double
- Quadruple
- Reduced by half
- Remains unaltered

No, the answer is incorrect.
Score: 0
Accepted Answers:
Double
