Flight dynamics I - Airplane performance - Web course

COURSE OUTLINE

FLIGHT DYNAMICS - I - AIRPLANE PERFORMANCE

1. Introduction.
   Definition and subdivisions of flight dynamics.
   Forces and moments acting on vehicles in flight.
   Equations of motion and simplification for performance analysis.

2. Earth's atmosphere and International Standard Atmosphere.

3. Drag polar.
   Various types of drags.
   Methods of estimating drag polar.
   Drag polar of vehicles from low speed to hypersonic speeds.
   High lift devices.

4. Review of the variations of thrust or power output and SFC with altitude and velocity for various air breathing engines.

5. Performance analysis.
   Steady level flight - Maximum speed, minimum speed and their variations with altitude.
   Steady climb - Maximum rate of climb, angle of climb and their variations with altitude; absolute ceiling and service ceiling.
   Range and endurance - Breguet formulae; range in constant velocity flight; effect of wind on the range.
   Accelerated level flight.
   Accelerated climb.

Pre-requisites:
The student is expected to have undergone courses on:

1. Vectors.
2. Rigid body dynamics.
3. Aerodynamics
4. Aircraft engines.

Additional Reading:

Manoeuvres - flight in vertical plane (loop); turn (minimum radius of turn and maximum rate of turn and their variations with the altitude).

V - n diagram.

Flight limitations.

Estimations of take-off distance and landing distance.

COURSE DETAIL

A Web course shall contain 40 or more 1 hour lecture equivalents.
