Introduction to Problem Solving and Programming - Video course

Course objective
To introduce students to the foundations of computing, programming and problem-solving. Also to develop basic programming skills necessary for engineering education. No pre-requisites required, suitable also for those with school level programming skills.

Course contents
Design of algorithms; Iterative versus recursive style; problem solving using a functional style; correctness issues in programming; efficiency issues in programming; time and space measures; Imperative style of programming; assertions and loop invariants; programming in an imperative language using advanced features: procedures, functions, list handling using references; file handling; objects and classes.

Lecture outline with topics (and no. of hours)
1. Basic model of computation, Notion of Algorithms, Principle of Mathematical Induction (4)
2. Basics of functional programming, notion of types (3)
3. Iterative versus recursive style (4)
4. Correctness and efficiency issues in programming, time and space measures (7)
5. Basics of imperative style programming (3)
6. Assertions and loop invariants (5)
7. Top down design and examples of step-wise refinement (5)
8. Programming using structures, introduction to encapsulation and object oriented programming (10)

Brief description of laboratory activities
1. Simple exercises and examples to introduce to student to the computing environment and usage of computers.
2. Simple exercises and examples of functional programming.
3. Examples of program correctness and experimental verification of efficiency and scaling.
4. Simple imperative programming.
5. A moderate size example of top down design, step-wise refinement and rapid prototyping to develop an imperative style modular program with structures.

Suggested texts and reference materials
3. How to solve it by Computer by R. J. Dromey, Prentice-Hall India EEE Series.
