Module 4: Deflection of Structures
Lecture 6: Maxwell-Betti Law of Reciprocal Deflections

Objectives
In this course you will learn the following

- Maxwell-Betti Law of reciprocal deflection.
- Illustrative examples for proving law of reciprocal deflection.

4.7 Maxwell-Betti Law of Reciprocal Deflections

Maxwell-Betti Law of real work is a basic theorem in the structural analysis. Using this theorem, it will be established that the flexibility coefficients in compatibility equations, formulated to solve indeterminate structures by the flexibility method, form a symmetric matrix and this will reduce the number of deflection computations. The Maxwell-Betti law also has applications in the construction of influence lines diagrams for statically indeterminate structures. The Maxwell-Betti law, which applies to any stable elastic structure (a beam, truss, or frame, for example) on unyielding supports and at constant temperature, states:

The deflection of point A in direction 1 due to unit load at point B in direction 2 is equal in the magnitude to the deflection of point B in direction 2 produced by a unit load applied at A in direction 1.

The Figure 4.31 explains the Maxwell-Betti Law of reciprocal displacements in which, the displacement $\Delta_{BA}$ is equal to the displacement $\Delta_{AB}$.

Figure 4.31 Illustration of Maxwell-Betti Law (directions 1 and 2 are shown by circle)
In order to prove the reciprocal theorem, consider the simple beams shown in Figure 4.32.

Let a vertical force $F_B$ at point B produces a vertical deflection $\Delta_{AB}$ at point A and $\Delta_{BB}$ at point B as shown in Figure 4.32(a). Similarly, in Figure 4.32(b) the application of a vertical force $F_A$ at point A produces a vertical deflections $\Delta_{AA}$ and $\Delta_{BA}$ at points A and B , respectively. Let us evaluate the total work done by the two forces $F_A$ and $F_B$ when they are applied in different order to the zero to their final value.

**Case 1: $F_B$ applied and followed by $F_A$**

(a) Work done when $F_B$ is gradually applied

$$W_B = \frac{1}{2} F_B \Delta_{BB}$$

(b) Work done when $F_A$ is gradually applied with $F_B$ in place

$$W_A = \frac{1}{2} F_A \Delta_{AA} + F_B \Delta_{BA}$$

Total work done by the two forces for case 1 is

$$W_1 = W_B + W_A = \frac{1}{2} F_B \Delta_{BB} + \frac{1}{2} F_A \Delta_{AA} + F_B \Delta_{BA} \quad (4.29)$$

**Case 2: $F_A$ applied and followed by $F_B$**

(c) Work done when $F_A$ is gradually applied

$$W_A = \frac{1}{2} F_A \Delta_{AA}$$

(d) Work done when $F_B$ is gradually applied with $F_A$ in place

$$W_B = \frac{1}{2} F_B \Delta_{BB} + F_A \Delta_{AB}$$

Total work done by the two forces for case 2 is

$$W_2 = W_B + W_A = \frac{1}{2} F_A \Delta_{AA} + \frac{1}{2} F_B \Delta_{BB} + F_A \Delta_{AB} \quad (4.30)$$

Since the final deflected position of the beam produced by the two cases of loads is the same regardless of
the order in which the loads are applied. The total work done by the forces is also the same regardless of the
order in which the loads are applied. Thus, equating the total work of Cases 1 and 2 give

\[
W_1 = W_2 \\
\frac{1}{2} F_B \Delta_{BB} + \frac{1}{2} F_A \Delta_{AA} + F_B \Delta_{BA} = \frac{1}{2} F_A \Delta_{AA} + \frac{1}{2} F_B \Delta_{BB} + F_A \Delta_{AB}
\]

(4.31)

If \( F_A = F_B = 1 \), the equation (4.31) depicts the statement of the Maxwell-Betti law i.e.

\[
\Delta_{BA} = \Delta_{AB}
\]

The Maxwell-Betti theorem also holds for rotations as well as rotation and linear displacement in beams and frames.

**Example 4.21** Verify Maxwell-Betti law of reciprocal displacement for the direction 1 and 2 of the pin-jointed
structure shown in Figure 4.33(a).

**Solution:** Apply the forces \( P_1 \) and \( P_2 \) in the direction 1 and 2, respectively. The calculation of total strain
energy in the system is given in Table 4.5.

<table>
<thead>
<tr>
<th>Member</th>
<th>Length</th>
<th>Force P</th>
<th>( U = P^2 L/2AE )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( AB )</td>
<td>( L )</td>
<td>(- (P_1 + P_2))</td>
<td>( (P_1 + P_2)^2 L/2AE )</td>
</tr>
<tr>
<td>( AC )</td>
<td>( \sqrt{2} L )</td>
<td>( \sqrt{2} P )</td>
<td>( \sqrt{2} P^2 L/2AE )</td>
</tr>
</tbody>
</table>
Since \( \Delta_{21} \), hence the Maxwell-Betti law of reciprocal displacement is proved.

**Example 4.22** Verify Maxwell-Betti law of reciprocal displacement for the cantilever beam shown in Figure 4.34(a).

**Solution:** Apply the forces \( P_1 \) and \( P_2 \) in the directions 1 and 2, respectively. The total strain energy stored is calculated below.

Consider any point \( X \) at a distance \( x \) from \( B \).

\[
M_x = -(P_1 x + P_2)
\]

\[
U = \int_0^L \frac{M_x^2}{2EI} \, dx
\]

\[
= \frac{1}{2EI} \int_0^L (P_1 x + P_2)^2 \, dx
\]

\[
= \frac{1}{2EI} \left( \frac{P_1^2 L^3}{3} + P_1 P_2 L^2 + P_2^2 L \right)
\]
Since \( t \), the Maxwekl-Betti law of reciprocal displacement is proved.

Example 4.23 Verify Maxwell-Betti law of reciprocal displacement for the rigid-jointed plane frame with reference to marked direction as shown in Figure 4.35(a).

\( EI \) is same for both members.

\[ \Delta_{12} = \frac{\partial U}{\partial R_1} \bigg|_{R_1=0, R_2=1} = \frac{1}{2EI} \left( \frac{2E_1L^3}{3} + 2L^2 + 0 \right) \bigg|_{R_1=0, R_2=1} = \frac{L^2}{2EI} \]

\[ \Delta_{21} = \frac{\partial U}{\partial R_2} \bigg|_{R_1=1, R_2=0} = \frac{1}{2EI} (0 + 2E_2L^2 + 2L^2) \bigg|_{R_1=1, R_2=0} = \frac{L^2}{2EI} \]

Since \( \Delta_{12} = \Delta_{21} \), the Maxwekl-Betti law of reciprocal displacement is proved.

Solution: Apply the forces \( R_1 \) and \( P_2 \) in the directions 1 and 2, respectively as shown in Figure 4.35(b).
Consider \( AB \) : ( \( x \) measured from \( A \))

\[
M_x = -R_1x
\]

\[
U_{AB} = \int_0^L \frac{M_x^2}{2EI} dx
= \frac{1}{2EI} \int_0^L (-R_1x)^2 dx
= \frac{R_1^2L^3}{6EI}
\]

Consider \( BC \) : ( \( x \) measured from \( B \))

\[
M_x = -R_1L - R_2x
\]

\[
U_{BC} = \int_0^L \frac{M_x^2}{2EI} dx
= \frac{1}{2EI} \int_0^L (-R_1L - R_2x)^2 dx
= \frac{R_1^2L^3}{2EI} + \frac{R_1R_2L^3}{2EI} + \frac{R_2^2L^3}{6EI}
\]

Thus

\[
U = U_{AB} + U_{BC}
= \frac{R_1^2L^3}{6EI} + \frac{R_1^2L^3}{2EI} + \frac{R_1R_2L^3}{2EI} + \frac{R_2^2L^3}{6EI}
= \frac{L^3}{6EI} (4R_1^2 + 3R_1R_2 + R_2^2)
\]

The displacement in the direction 1 due to unit load applied in 2 is

\[
\Delta_{12} = \frac{\partial U}{\partial R_2} \bigg|_{R_1=0, R_2=1}
= \frac{L^3}{6EI} \left[ 8R_1 + 3R_2 + 0 \right]_{R_1=0, R_2=1}
\]
The displacement in the direction 2 due to unit load applied in 1 is

\[ \Delta_{21} = \frac{L^3}{2EI} \]

Recap

In this course you have learnt the following

- Maxwell-Betti Law of reciprocal deflection.
- Illustrative examples for proving law of reciprocal deflection.
