Module 7: Discrete State Space Models
Lecture Note 2

In this lecture we will discuss about the relation between transfer function and state space model for a discrete time system and various standard or canonical state variable models.

1 State Space Model to Transfer Function

Consider a discrete state variable model

\[
\begin{align*}
    x(k+1) &= Ax(k) + Bu(k) \\
    y(k) &= Cx(k) + Du(k)
\end{align*}
\]  \hspace{1cm} (1)

Taking the Z-transform on both sides of Eqn. (1), we get

\[
\begin{align*}
    zX(z) - zx_0 &= AX(z) + BU(z) \\
    Y(z) &= CX(z) + DU(z)
\end{align*}
\]

where \(x_0\) is the initial state of the system.

\[
\Rightarrow (zI - A)X(z) = zx_0 + BU(z) \\
\text{or, } X(z) = (zI - A)^{-1}z x_0 + (zI - A)^{-1}BU(z)
\]

To find out the transfer function, we assume that the initial conditions are zero, i.e., \(x_0 = 0\), thus

\[
Y(z) = \left(C(zI - A)^{-1}B + D\right)U(z)
\]

Therefore, the transfer function becomes

\[
G(z) = \frac{Y(z)}{U(z)} = C(zI - A)^{-1}B + D
\]  \hspace{1cm} (2)

which has the same form as that of a continuous time system.
2 Various Canonical Forms

We have seen that transform domain analysis of a digital control system yields a transfer function of the following form.

\[
G(z) = \frac{Y(z)}{U(z)} = \frac{\beta_0 z^m + \beta_1 z^{m-1} + \ldots + \beta_m}{z^n + \alpha_1 z^{n-1} + \ldots + \alpha_n} \quad m \leq n
\]  

Various canonical state variable models can be derived from the above transfer function model.

2.1 Controllable canonical form

Consider the transfer function as given in Eqn. (3). Without loss of generality, let us consider the case when \(m = n\). Let

\[
\frac{X(z)}{U(z)} = 1
\]

In time domain, the above equation may be written as

\[
x(k+n) + \alpha_1 x(k+n-1) + \ldots + \alpha_n x(k) = u(k)
\]

Now, the output \(Y(z)\) may be written in terms of \(X(z)\) as

\[
Y(z) = (\beta_0 z^n + \beta_1 z^{n-1} + \ldots + \beta_n) \bar{X}(z)
\]

or in time domain as

\[
y(k) = \beta_0 x(k+n) + \beta_1 x(k+n-1) + \ldots + \beta_n x(k)
\]

The block diagram representation of above equations is shown in Figure 1. State variables are selected as shown in Figure 1.

The state equations are then written as:

\[
\begin{align*}
x_1(k+1) &= x_2(k) \\
x_2(k+1) &= x_3(k) \\
& \quad \vdots \\
x_n(k+1) &= -\alpha_n x_1(k) - \alpha_{n-1} x_2(k) - \ldots - \alpha_1 x_n(k) + u(k)
\end{align*}
\]

Output equation can be written as by following the Figure 1.

\[
y(k) = (\beta_n - \alpha_n \beta_0)x_1(k) + (\beta_{n-1} - \alpha_{n-1} \beta_0)x_2(k) + \ldots + (\beta_1 - \alpha_1 \beta_0)x_n(k) + \beta_0 u(k)
\]

In state space form, we have

\[
\begin{align*}
x(k+1) &= Ax(k) + Bu(k) \\
y(k) &= Cx(k) + Du(k)
\end{align*}
\]
Figure 1: Block Diagram representation of controllable canonical form

where

\[
A = \begin{bmatrix}
0 & 1 & 0 & \ldots & 0 \\
0 & 0 & 1 & \ldots & 0 \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
0 & 0 & 0 & \ldots & 1 \\
-\alpha_n & -\alpha_{n-1} & -\alpha_{n-2} & \ldots & -\alpha_1
\end{bmatrix}
\]

\[
B = \begin{bmatrix}
0 \\
0 \\
\vdots \\
0 \\
1
\end{bmatrix}
\]

\[
C = [\beta_n - \alpha_n\beta_0 \ \beta_{n-1} - \alpha_{n-1}\beta_0 \ \ldots \ \beta_1 - \alpha_1\beta_0]
\]

\[
D = \beta_0
\]

### 2.2 Observable Canonical Form

Equation (3) may be rewritten as

\[
(z^n + \alpha_1 z^{n-1} + \ldots + \alpha_n) Y(z) = (\beta_0 z^n + \beta_1 z^{n-1} + \ldots + \beta_n) U(z)
\]

or,

\[
z^n[Y(z) - \beta_0 U(z)] + z^{n-1}[\alpha_1 Y(z) - \beta_1 U(z)] + \ldots + [\alpha_n Y(z) - \beta_n U(z)] = 0
\]

or,

\[
Y(z) = \beta_0 U(z) - z^{-1}[\alpha_1 Y(z) - \beta_1 U(z)] - \ldots - z^{-n}[\alpha_n Y(z) - \beta_n U(z)]
\]

The corresponding block diagram is shown in Figure 2. Choosing the outputs of the delay blocks
as the state variables, we have following state equations

\[
\begin{align*}
x_n(k+1) &= x_{n-1}(k) - \alpha_1 x_n(k) + \beta_0 u(k) + \beta_1 u(k) \\
x_{n-1}(k+1) &= x_{n-2}(k) - \alpha_2 x_n(k) + \beta_0 u(k) + \beta_2 u(k) \\
&\vdots \\
x_1(k+1) &= -\alpha_n x_n(k) + \beta_0 u(k) + \beta_n u(k) \\
y(k) &= x_n(k) + \beta_0 u(k)
\end{align*}
\]

This can be rewritten in matrix form (4) with

\[
A = \begin{bmatrix}
0 & 0 & 0 & \ldots & 0 & -\alpha_n \\
1 & 0 & 0 & \ldots & 0 & -\alpha_{n-1} \\
0 & 1 & 0 & \ldots & 0 & -\alpha_{n-2} \\
\vdots & \vdots & \vdots & \ldots & \vdots & \vdots \\
0 & 0 & 0 & \ldots & 1 & -\alpha_1
\end{bmatrix} \quad B = \begin{bmatrix}
\beta_n - \alpha_n \beta_0 \\
\beta_{n-1} - \alpha_{n-1} \beta_0 \\
\vdots \\
\beta_1 - \alpha_1 \beta_0
\end{bmatrix} \quad C = [0 \ 0 \ \ldots \ 1] \quad D = \beta_0
\]

### 2.3 Duality

In previous two sections we observed that the system matrix \(A\) in observable canonical form is transpose of the system matrix in controllable canonical form. Similarly, control matrix \(B\) in observable canonical form is transpose of output matrix \(C\) in controllable canonical form. So also output matrix \(C\) in observable canonical form is transpose of control matrix \(B\) in controllable canonical form.
2.4 Jordan Canonical Form

In Jordan canonical form, the system matrix $A$ represents a diagonal matrix for distinct poles which basically form the diagonal elements of $A$.

Assume that $z = \lambda_i, \ i = 1, 2, \ldots, n$ are the distinct poles of the given transfer function (3). Then partial fraction expansion of the transfer function yields

$$
\frac{Y(z)}{U(z)} = \beta_0 + \frac{\bar{\beta}_1 z^{n-1} + \bar{\beta}_2 z^{n-2} + \ldots + \bar{\beta}_n}{z^n + \alpha_1 z^{n-1} + \ldots + \alpha_n}
= \beta_0 + \frac{\bar{\beta}_1 z^{n-1} + \bar{\beta}_2 z^{n-2} + \ldots + \bar{\beta}_n}{(z - \lambda_1)(z - \lambda_2) \ldots (z - \lambda_n)}
= \beta_0 + \frac{r_1}{z - \lambda_1} + \frac{r_2}{z - \lambda_2} + \ldots + \frac{r_n}{z - \lambda_n}
$$

(5)

A parallel realization of the transfer function (5) is shown in Figure 3.

---

1. Kar
When the matrix $A$ has repeated eigenvalues, it cannot be expressed in a proper diagonal form. However, it can be expressed in a Jordan canonical form which is nearly a diagonal matrix. Let us consider that the system has eigenvalues, $\lambda_1, \lambda_1, \lambda_2$, and $\lambda_3$. In that case, $A$ matrix in Jordan canonical form will be

$$A = \begin{bmatrix} \lambda_1 & 1 & 0 & 0 \\ 0 & \lambda_1 & 0 & 0 \\ 0 & 0 & \lambda_2 & 0 \\ 0 & 0 & 0 & \lambda_3 \end{bmatrix}$$

1. The diagonal elements of the matrix $A$ are eigenvalues of the same.
2. The elements below the principal diagonal are zero.
3. Some of the elements just above the principal diagonal are one.
4. The matrix can be divided into a number of blocks, called Jordan blocks, along the diagonal. Each block depends on the multiplicity of the eigenvalue associated with it. For example Jordan block associated with an eigenvalue $z_1$ of multiplicity 4 can be written as

$$A = \begin{bmatrix} z_1 & 1 & 0 & 0 \\ 0 & z_1 & 1 & 0 \\ 0 & 0 & z_1 & 1 \\ 0 & 0 & 0 & z_1 \end{bmatrix}$$

**Example:** Consider the following discrete transfer function.

$$G(z) = \frac{0.17z + 0.04}{z^2 - 1.1z + 0.24}$$

Find out the state variable model in 3 different canonical forms.

**Solution:**

The state variable model in controllable canonical form can directly be derived from the transfer function, where the $A$, $B$, $C$ and $D$ matrices are as follows:

$$A = \begin{bmatrix} 0 & 1 \\ -0.24 & 1.1 \end{bmatrix}, \quad B = \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \quad C = \begin{bmatrix} 0.04 & 0.17 \end{bmatrix}, \quad D = 0$$

The matrices in state model corresponding to observable canonical form are obtained as,

$$A = \begin{bmatrix} 0 & -0.24 \\ 1 & 1.1 \end{bmatrix}, \quad B = \begin{bmatrix} 0.04 \\ 0.17 \end{bmatrix}, \quad C = \begin{bmatrix} 0 & 1 \end{bmatrix}, \quad D = 0$$
To find out the state model in Jordan canonical form, we need to fact expand the transfer function using partial fraction, as

\[
G(z) = \frac{0.17z + 0.04}{z^2 - 1.1z + 0.24} = \frac{0.352}{z - 0.8} + \frac{-0.182}{z - 0.3}
\]

Thus the \( A, B, C \) and \( D \) matrices will be:

\[
A = \begin{bmatrix} 0.8 & 0 \\ 0 & 0.3 \end{bmatrix}, \quad B = \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \quad C = \begin{bmatrix} 0.352 & -0.182 \end{bmatrix}, \quad D = 0
\]
